

Sprint 2 Retrospective - 10/5/2025

Members: Charlie, Pradeep, Aurora, Wang

Date: 10/5/2025

Agenda

- Review progress made from last sprint, talk about what worked, what didn't
- What did we like best from last sprint?
- What did we dislike from last sprint?
- What should we change moving forward?
- What should stay the same moving forward?
- Any thoughts & suggestions to improve our next sprint and ensure its successful moving forward to the end of the project

Details

- We did improve communication this sprint and made sure that everyone was more aware of what they were doing however, there was still some areas to be improved and we should work harder to keep everyone in the loop and informed everytime we do work on the application
 - Be more active in the slack!! → need group members to be more responsive of slack updates and respond to meeting proposals/invites
- Group members still need to work on learning what the project deliverables are and being more proactive in the project and what they should do
 - It is hard to be proactive when there is not great communication sometimes but the baseline is that work needs to be completed regardless so it's better to have some work completed than none at all
 - Primarily, some group members made a lot of architectural and system application decisions that went against some of the deliverable requirements however it became too integrated into the application and difficult to refactor at a later date. Please please please

do not make this mistake again in the future as it is extremely detrimental to the entire team.

- We should try to make more of an effort to follow TDD in the future and emphasize writing test cases first. Writing so many test cases at the end of the project was tedious and definitely not the best practice we could have followed
- We also needed to do a better job of keeping track of the sprint including dates that tasks were completed as well as task delivery, increments, and overall project velocity.
 - Could also work more onto keeping slightly better documentation as we go, especially for architecture, database schema, and application workflow decisions.

Decisions

- We hope that all group members bring the insights and knowledge gained from working on this project to future projects and continue to practice the best software development methodologies and heuristics going forward
- Try to do things ahead of time and keep communications clear and concise between all team members. It is extremely important to keep all team members updated about what you are doing to ensure that no work is conflicting and each team member is able to bring value to the team
- Be proactive in learning the tech stack and the related technologies. While it is a team project, each team member has their own responsibilities and work to complete. Agile is supposed to be a self-organizing methodology, for this purpose it is important that each team member is capable of facing each of the problems they encounter on their own, of course help and collaboration is encouraged but it should not be an expectation for task completion.
